

Slant Asymptotes
Try This: Sketch the following rational function. Be sure to find all key features!!

1) $f(x) = \frac{5+2x}{x-1}$

VA $\rightarrow 1+x=0$
 $x=-1$

HA $\rightarrow \frac{2x}{x} \rightarrow y=2 \rightarrow y=2$

X-int $\rightarrow (-\frac{5}{2}, 0)$
 $\frac{5+2x}{x-1} = 0$
 $5+2x=0$
 $2x=-5$
 $x=-\frac{5}{2}$

Y-int $(0, 5)$
 $\frac{5+2(0)}{(0-1)} = \frac{5}{-1} = -5$
 $f(-6) = \frac{5+2(-6)}{-6-1} = \frac{-7}{-7} = 1$
 $f(4) = \frac{5+2(4)}{4-1} = \frac{13}{3}$

Slant Asymptotes:
-If the degree of the numerator is exactly one more than the degree of the denominator then the function has a **slant asymptote**.
-If there is a slant asymptote use **long division** to find the equation of the asymptote, the **dividend is the numerator** and the **divisor is the denominator**, the slant asymptote is the **quotient**.

Without the remainder

Example: Find the slant asymptote.

1) $f(x) = \frac{x^2-x-2}{x-1}$

$x-1 \overline{) x^2 - x - 2}$
 $-(x^2 + x)$
 $\underline{-2}$

S.A. $\rightarrow y=x$

2) $f(x) = \frac{x^2+x-1}{x+2}$

$x+2 \overline{) x^2 + x - 1}$
 $-(x^2 + 2x)$
 $\underline{-x - 1}$
 $-(x + 2)$
 $\underline{-1}$

S.A. $\rightarrow y=x-1$

Now, let's graph with them!

3) $f(x) = \frac{x^2-x-2}{x-1} = \frac{(x-2)(x+1)}{x-1}$

NO holes!

VA $\rightarrow x-1=0$
 $x=1$

HA $\rightarrow \frac{x^2}{x}$ NONE

SA $\rightarrow y=x+1$

X-int $\frac{(x-2)(x+1)}{x-1} = 0$
 $(x-2)(x+1)=0$
 $x-2=0 \quad x+1=0$
 $x=2 \quad x=-1$
 $(2, 0) \quad (-1, 0)$

Y-int $\frac{(0-2)(0+1)}{(0-1)} = \frac{-2(-1)}{-1} = 2$
 $(0, 2)$
 $f(3) = \frac{(3-2)(3+1)}{3-1} = \frac{1 \cdot 4}{2} = 2$

*When you have a slant asymptote, there is no horizontal asymp

4) $f(x) = \frac{x^2-x-1}{x-3}$

5) $f(x) = \frac{x^2+x-2}{x+1} = \frac{(x-1)(x+2)}{x+1}$

NO holes!

VA $\rightarrow x+1=0$
 $x=-1$

HA $\rightarrow \frac{x^2}{x}$ NONE

SA $\rightarrow y=x$

X-int $\left\{ \begin{array}{l} (-2, 0) \\ (1, 0) \end{array} \right.$

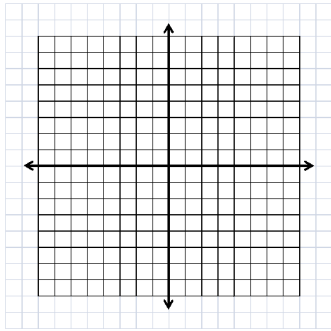

Y-int $\left\{ \begin{array}{l} (0, -2) \end{array} \right.$

$x+1 \overline{) x^2 + x - 2}$
 $-(x^2 + x)$
 $\underline{-2}$

$f(-3) = \frac{(-3-1)(-3+2)}{-3+1} = \frac{-4(-1)}{-2} = 2$

6) $f(x) = \frac{x^2+x-6}{x-3}$

7) $f(x) = \frac{x^2 - 2x - 3}{x - 2}$

8) $f(x) = \frac{x^2 - 2x - 12}{x - 5}$
